# Natural Stones

Federchemicals, a leader company in its field, which is always engaged in the research for innovative products, is glad to present a new high-tech line of products for the cleaning, the protective and strengthening treatment of natural stones such as: marble, travertine, granite and agglomerates of different stones, slate, gneiss, sandstone and all mined and worked stones.

Thanks to their quality and characteristics, these stones have represented, for many centuries, the best and most elegant choice in the building field for the realization of floorings and facings of high aesthetic value.

Federchemicals is capable of offering high quality products and all the necessary information helpful to make best use of them and to solve any kind of problem linked to building materials.

These elements and also the skill of our personnel, the constant control of the products, the professionalism of our management staff and the intensive research activities have determined the great success of our products.

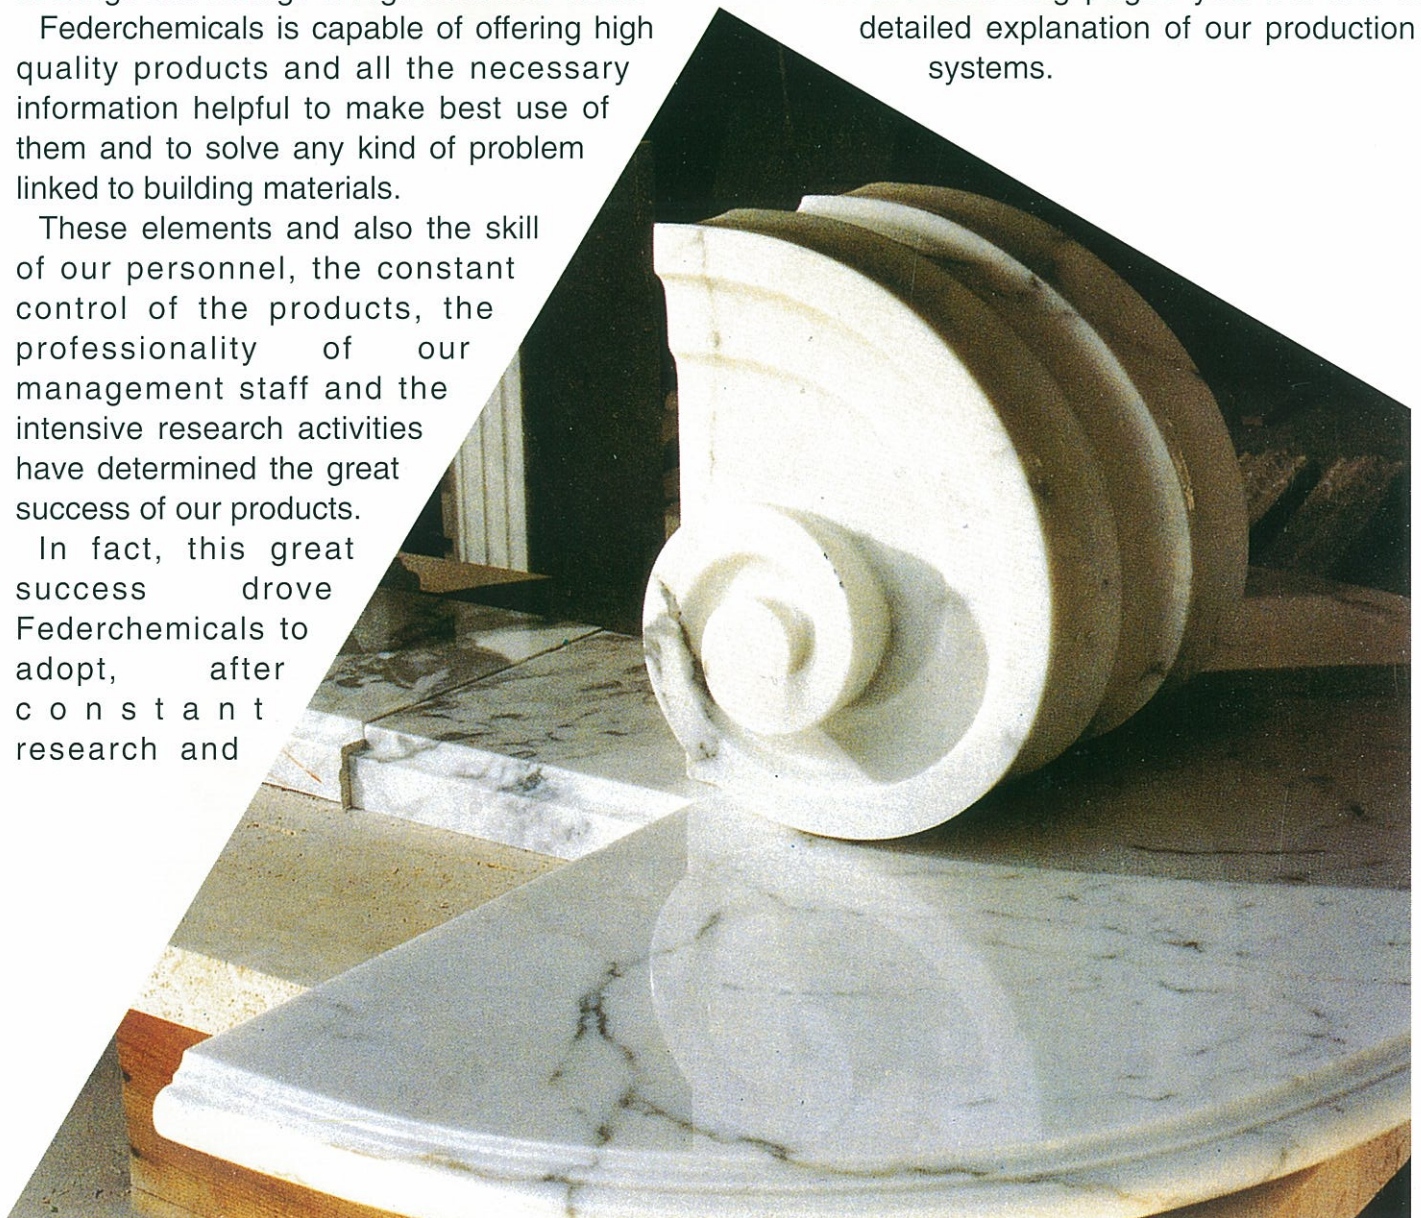

In fact, this great success drove Federchemicals to adopt, after constant research and

investment, exclusive systems for the initial treatment and the maintenance of floors made of marble, granite, natural stones and fine porcelainized grès.

A complete line of products and treatment programs suitable to exalt the natural beauty of the treated materials and to preserve and protect them.

Products by Federchemicals, a company with its headquarters in Brescia (Italy), are present with high shares in the Italian market, in the European market (particularly in Germany, France, Spain and Greece) and also in Japan.

On the following pages you will find a detailed explanation of our production systems.

# Surface Finish and Treatment

For surface finish and treatment we have prepared a wide range of products which are specific for the different types of stones. They must be selected according to the surface treatment to be performed on either natural stone floors or grit agglomerate floors; these surface treatments go from the rough finish to the dressed finish which can be obtained by means of final polishing.

A very important role is played by the type of protection and maintenance to be performed afterwards. Our aim is to provide products capable of protecting marble, granite and other natural stones against the polluting substances which cause their deterioration.
